Applicant argues that both Sato and McGrath focus on separate and distinct problems from each other and the claimed invention. Examiner disagrees. Each of the references cited and the claimed invention are concerned with isolation of a processing evironment. McGrath does infact address heat transfer through a chamber structure. The baffle gate chambers, similar to the thermally isolating interface of the claimed invention are provided to isolate the heat in a firing chamber from an environment outside the firing chamber. As interface of the claimed invention are provided to isolate the heat in a firing chamber from an environment outside the firing chamber. As noted in the previous office action, the gate valve of Sato functions as a thermally isolating interface, most effectively when closed. However, the interface does not include all of the recitations of the Applicant's claims. McGrath was cited in addition to Sato to remedy these deficiencies. The combination of Sato and McGrath form the basis for the rejections in the previous office action. Applicant has attempted to attack each of the referenes individually by arguing that McGrath would not be capable of maintaining two adjacent environments at separate pressures, however, McGrath is not relied upon for this teaching. Sato is constructed for maintaining environments at two pressures. Likewise, Sato is supplemented with the teachings of McGrath because McGrath provides additional teachings regarding temperature isolation which are not found in Sato. With regards to Applicant's argument that McGrath does not disclose two chambers coupled to two sides of an isolation apparatus, Examiner again points out that McGrath is not relied upon for this teaching. McGrath is relied upon for a specific teaching of thermally isolating two separate environments within a system. Sato is relied upon for teaching the physical connectivity of those two environments and other environments within the system.
